Student Responses

Answer the following questions

Question 1

Comment out the `asm` line. Run the program again to see what would happen. What do you observe that happens differently than before :

The CPU no longer enters WFI sleep mode. it keeps looping continuously and prints the message in repeat. This uses more power because the CPU is always active instead of sleeping until the next interrupt.

Question 2

In terms of CPU power consumption, what difference does the `asm` statement make?

It makes the CPU enter WFI sleep mode and this uses less power and keeps sleeping until the next interrupt.
